The invention relates to 4 novel types of ammonia-oxidising bacteria (AOB) found in freshwater aquaria. The bacteria are able to oxidise ammonia to nitrite and are members of the ammonia-oxidising bacteria family of the beta subdivision of Proteobacteria. The 4 types of bacteria can de distinguished on the basis of their 16S rRNA (ribosomal RNA) gene

New bacteria capable of oxidizing ammonia to nitrite, for preventing or alleviating the accumulation of ammonia in fresh water aquaria, seawater aquaria and waste water.

                                                            This sequence represents a probe which was used in the detection of 16S rDNA sequence derived from an ammonia oxidising bacteria (AOB). The amplified sequence may be used in a composition which comprises an isolated bacterial strain that oxidizes ammonia to nitrite. The composition may be used for alleviating or preventing the accumulation of ammonia in a medium. The ammonia is reduced by at least 30% when compared with a level of ammonia that would exist in the absence of the bacterial strain. The composition is useful for alleviating or preventing the secural stop of ammonia in aqueous environment, e.g. a freshwater or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g., R7clone140), type A1 (e.g., R7clone187), type B (e.g., R3clone5) and type C (e.g., R3clone47). The invention also encompasses isolated 165 rRNA gene sequences of the ammonia-oxidising bacteria of the invention, oligonucleotide probes and primers for the detection of these bacteria, and compositions comprising the bacteria. The bacteria of the invention are useful in biological filters for reducing ammonia accumulation in both freshwater and seawater aquaria. They may also be used in waste water treatment and in bioremediation processes to reduce the level of pollution caused by ammonia. The present sequence represents a specifically claimed probe for the detection of the 165 rRNA gene sequences of the type A and A1 ammonia-oxidising bacteria (ABA02416-ABA02417). (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising an isolated bacterial strain that oxidizes ammonia to nitrite, useful for alleviating or preventing the accumula
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             19-SEP-2002; 2002US-0386217P.

                                                                    The invention relates to a novel isolated 17 mer nucleic acid sequence, CC given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal that it least 80 % identity to the 17 mer sequence with, after optimal to fany of them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic cof any of the invention are useful as probes and primers for detecting, identifying, quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti)sense resgents, and for production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti)sense resgents and for production of recombinant polypeptides. Any of the nucleic acids, component of a gene chip, in vitro as (anti)sense resgents and for complement of vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Albeimer's disease and components. Analysis of the expression of the 17 mer nucleic acids in patient samples is useful for disgnosis and/or prognosis of these contains. The polypeptides can also be used to generate antibodies, and both the polypeptide acid sequences of the invention can be used in gene chips. The nucleic acid sequences of the invention can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18 BP; 2 A; 9 C; 2 G; 5 T; 0 U; 0 Other;

                                                                                                                                                                                                                 The present invention relates to murine oligonucleotides (ACC62754-ACC68866), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The Oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene chip; in vitro as (anti)sense resgents; and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia

                                                                                                                                                                                                                                                                                             밁
                                                                                                                                                                                          S
                                                                                                                                                                                                                                                                                                                   The invention relates to the isolation of 6327 nucleotide sequences, and consequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as superimental models. The nucleotides (also vectors containing the vectors), the encoded polypeptides and antibodies (cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Allzheimer's disease or schizophrenia).

Chalysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can be used to screen for their specific interactive molecules, as potentially useful for treating diseases associated with abnormal contentials.
                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a new isolated DNA molecule, encoding a monocyte-macrophage cell surface aposas receptor protein (aposass) comprising a fully defined 1088 amino acid sequence. The DNA molecule is useful in preparing a composition for treating Pattern B phenotype, familial combined hyperlipidaemia, familial or non-familial hypercholesterolaemia, hypertripidyceridaemia or low plasma high-density lipoprotein levels. This sequence represents a primer used in the isolation of human monocyte-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated DNA molecule encoding a monocyte-macrophage cell surface apoB48 receptor protein (apoB48R), useful in preparing a composition treating e.g., familial or non-familial hypercholesterolemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         06-AUG-1998; 98US-00130242.

                                                                                                                                                                                                                                                                                                                                                                     밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cc encoding it. The invention also relates to a method of cell-specific conditions it. The invention also relates to a method of cell-specific conditions of therapeutic compounds to human monocytes, macrophages or other reticuloendothelial cells that express the receptor, a method of chihibiting foam cell formation and increased monocyte adhesion to conditions and increased monocyte adhesion to conditions cells and a method of evaluating an individual at risk of a cardiovascular disease. The monocyte-macrophage cell surface apo848 creceptor protein is useful in the apoB-mediated cellular uptake of plasma chylomicrons and remnants and hypertriglyceridaemic triglyceride-rich conditions and remnants and hypertriglyceridaemic triglyceride-rich confident pathway or a heparin sulfate proteoplycan independent confident pathway or a heparin sulfate proteoplycan independent confident to human monocytes, macrophages or other reticuloendothelial confident that express the receptor, for inhibiting foam cell formation and conditional at risk of a cardiovascular disease such as the risk of a cardiovascular disease such as Conditional at risk of a cardiovascular disease such as Conditional conditions and conditional conditions of cDNA encoding the apo848R protein of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC (ADB) found in freshwater aquaria. The bacteria are able to oxidise cammonia to nitrite and are members of the ammonia-oxidising bacteria are able to oxidise cammonia to nitrite and are members of the ammonia-oxidising bacteria are able to oxidise cammonia to nitrite and are members of the ammonia-oxidising bacteria are able to oxidise cammonia to nitrite and are members of the interval are also and types of bacteria are distinguished on the basis of their 165 rRNA (ribosomal RNA) gene are gequences (ABA02416-ABA02419), and are classified as AOB type A (e.g., R7clone140), type A1 (e.g., R7clone187), type B (e.g., R3clone5) and type CC (e.g., R3clone47). The invention also encompasses isolated 165 rRNA (ribosomal representation) are useful in biological filters for the detection of these bacteria, are described and compositions comprising the bacteria. The bacteria of the invention are useful in biological filters for reducing ammonia accumulation in both freshwater and seawater aquaria. They may also be used in waste water treatment and in bioremediation processes to reduce the level of pollution caused by ammonia. Sequences ABA02421-ABA02422 represent PCR conditions for the detection of the 165 rRNA gene sequences of the type A and A1 ammonia-oxidising bacteria (ABA02416-ABA02417). (Updated on 29-AUG cond A1 ammonia-oxidising bacteria (ABA02416-ABA02417).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Query Match

The ammonia is reduced by at least 30% when compared with a level of ammonia that would exist in the absence of the bacterial strain. The composition is useful for alleviating or preventing the accumulation of ammonia in aqueous environment, e.g. a freshwater or

The cPPT and CTS regions induce a 3-stranded CC DNA structure which stimulates entry of nucleic acids into the nucleus of cells. The triplex structures can act as nucleic acid importers into non-compared to the prophylactic, ameliorative or curative treatment of an individual suffering from or having a high likelihood of developing a compared to a patient using a vector containing the compared to a patient using a vector containing DNA encoding the corotein and the nucleotide sequence of the invention. Diseases and compared the nucleotide sequence of the invention. Diseases and compared the nucleotide sequence of the invention. Diseases and compared the nucleotide sequence of the invention. Diseases and compared disorders which can be treated include blood disorders, brain or nervous system disorders or developmental disorders. The present sequence compared the invention of reverse transcription is an example illustrating that central initiation of reverse transcription is an essential step of the compared to the central initiation of reverse transcription is an essential step of the central initiation of reverse transcription is an example illustrating contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        central termination sequence (CTS) cis acting regions of a retrovirus. The CPPT region initiates synthesis of a downstream plus strand during reverse transcription and CTS is involved in the termination and ejection of reverse transcriptase. The CPPT and CTS regions induce a 3-stranded

The present sequence represents a potential triple-helix forming region. It can be used to demonstrate the assay of the invention. The assay comprises adding a sample containing double-stranded DNA test sequences, e.g. containing the present sequence, to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where either a part of the anchor DNA or reporter DNA is

The lentiviral polymucleotide sequences are useful in gene therapy for preparing a composition for treating an individual suffering from, or having a likelihood of developing a disorder such as brain or developmental disease. The present sequence encodes a mutant HIV-1 CPPT peptide.
                                                                                                                                           Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, w reporter released if triplex formation occurs, used e.g. to ident

                                                                                                            AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAX94584- AAX95879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae esquences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccin neutralising epitope; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which is detected as an indication of the presence of the DNA test which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for identification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus
                                                                                       Sequence

```

The invention relates to an isolated polypeptide, comprising a variant CC form of mouse or human SAC1 polypeptide. The variant form is associated CC with altered preference for carbohydrates, other sweeteners or ethanol. CC The polypeptide and its associated DNA sequence can be produced by CC recombinant techniques and is useful for preventing obesity, diabetes or CC alcoholism associated with SAC1 expression. The sequences are useful in CC screening for drugs and sweeteners. Recombinant cell lines and transgenic CC embryos may be used in screening for and identifying agents that induce CC or repress function of SAC1. Predisposition to diabetes, obesity or CC cloholism can be ascertained by testing any fluid or tissue of a human CC (such as blood, pancreas or tongue) for sequence variations of the SAC1 CC gene. A sequence variation of the SAC1 locus may indicate a CC diagnostic mark. The polynucleotide can be detected in a biological CC sample by contecting the DNA with a probe to form a hybridisation complex which is then detected. The sequences represent cDNA encoding human and course SAC1 polypeptides and PCR primers specific for the SCA1 genes

                                                                                                                                                                                                                                                                             The invention relates to diagnosing congenital hemidysplasia, CC ichthyosiform erythroderma and limb defects (CHILD) syndrome or psoriasis CC in a patient, involves detecting nucleotide difference between patient CC NSDHL oligonucleotide (gene encoding 3beta-hydroxysteroid dehydrogenase CC (3beta-HSD)) and wild type NSDHL gene, or detecting accumulation of CC sterol intermediates before the generation of cholest-8(9)-en-3beta-01 in CC the cholesterol biosynthetic pathway, in the body fluids or cells of the CC patient. The method is useful for diagnosing CHILD syndrome and psoriasis CC in a patient. Other diseases implicated in defects of the cholesterol CC biosynthetic pathway include mevalonic aciduria, desmosterolosis, Smith-CC temil-Opitz syndrome (SLOS), Conradi-Hunermann-Happle syndrome; CC chondroplasia punctata (X-linked disease), bone disorders, osteoporosis, CC condeceptosis, skin disorders, ichthyosis, eye disorders, (e.g. cataract CC and microopthagmia) and arthritis. The human NSDHL gene is located on CC chromosome X128. The present sequence is a primer for routine sequencing CC of and mutation detection in the human NSDHL gene (one of 8 exons or the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ; RELEVANT RESIDUES IN SEQ ID NO: US-08-173-489C-17
Sequence 2493, Application US/09198452A

Patent No. 6559294

GENERAL INFORMATION:
APPLICANT: Griffais, R.

TITLE OF INVENTION: Chlamydia pneumoniae genomic sequence and polypeptides, fragments
TITLE OF INVENTION: thereof and uses thereof, in particular for the diagnosis, preve
TITLE OF INVENTION: and treatment of infection
TITLE OF INVENTION: and treatment of infection
FILE REFERENCE: 9710-003-999
CURRENT APPLICATION NUMBER: US/09/198,452A
CURRENT FILING DATE: 1998-11-24
NUMBER OF SEQ ID NOS: 6849

SEQ ID NO 2493
LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ORIGINAL SOURCE:

STRANDEDNESS: double
TOPOLOGY: linear
MOLECULE TYPE: Genomic DNA
DESCRIPTION: n-myc gene (Accession # Y00664)
DESCRIPTION: nucleotides 2407 to 2426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              COMPUTER: IBM PC/XT/AT

i Sequence 23, Application US/0914235B

i Patent NO. 6184012

i GENERAL INFORMATION:

APPLICANT: Neri, Dario

APPLICANT: Demartie, Salvatore

APPLICANT: Demartie, Salvatore

APPLICANT: Winter, Adrain

APPLICANT: Winter, Gregory Paul

TITLE OF INVENTION: Isolation of Enzymes

FILE REFERENCE: 2224/0E65

CURRENT APPLICATION NUMBER: US/09/142,355B

CURRENT FILING DATE: 1996-09-04

PRIOR APPLICATION NUMBER: GB 9608540.2

PRIOR APPLICATION NUMBER: PCT/GB97/01153

PRIOR PILING DATE: 1997-04-25

PRIOR FILING DATE: 1997-04-25

INUMBER OF SEQ ID NOS: 24

SOPTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 23

LENGTH: 25

TYPE: DNA
ORGANISM: Artificial Sequence
PEATURE:

OTHER INFORMATION: primer

Patent No. 6821724
GENERAL INFORMATION:
APPLICANT: Michael Mittmann
APPLICANT: David Mack
APPLICANT: David Lockhart
APPLICANT: NUMBER: US/09/396,1966
TITLE OF INVENTION: Methods of Genetic Analysis
FILE REFERENCE: 3101.1
CURRENT APPLICATION NUMBER: US/09/396,196G
CURRENT FILING DATE: 199-09-15
PRIOR APPLICATION NUMBER: 60/100,678
PRIOR FILING DATE: 1998-09-17
NUMBER OF SEQ ID NOS: 127806
SOFTWARE: FastSEQ for Windows Version 4.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
                                                                                                                                                                                                                                                                                                                                                          RESULT 7
